

10094
Regolith Breccia
30.3 grams

Figure 1: Lunar breccia 10094 is about 3 cm across. NASA S76-25993.

Introduction

10094 is a typical Apollo 11 regolith breccia. Its outer surface was bombarded with micrometeorites (figures 1 and 2). It has a high percentage of fine dark matrix, and an abundance of small clasts of mare basalt (figure 3).

Petrography

Simon et al. (1984) included breccia 10094 in their comprehensive study of Apollo 11 regolith breccias – their mode is given in the table. They calculated that it had about 24 % highland component, but couldn't directly identify that many clasts of highland rock.

Chemistry

Rhodes and Blanchard (1981) found that the composition of 10094 was similar to the other regolith breccias and 10084 (figures 4 and 5).

Processing

Apollo 11 samples were originally described and catalogued in 1969 and “recatalogued” by Kramer et al. (1977). There are 4 thin sections.

Simon's Mode for 10094

	S	L
Mare Basalt	8.2	6.2
Highland Component	0.5	0.5
Regolith breccia	3.3	
Agglutinate	5.5	3.3
Pyroxene	4	
Olivine	0.5	
Plagioclase	4	0.1
Ilmenite	2.6	
Orange glass	1.4	
Other glass	3.4	
Matrix	56.5 %	

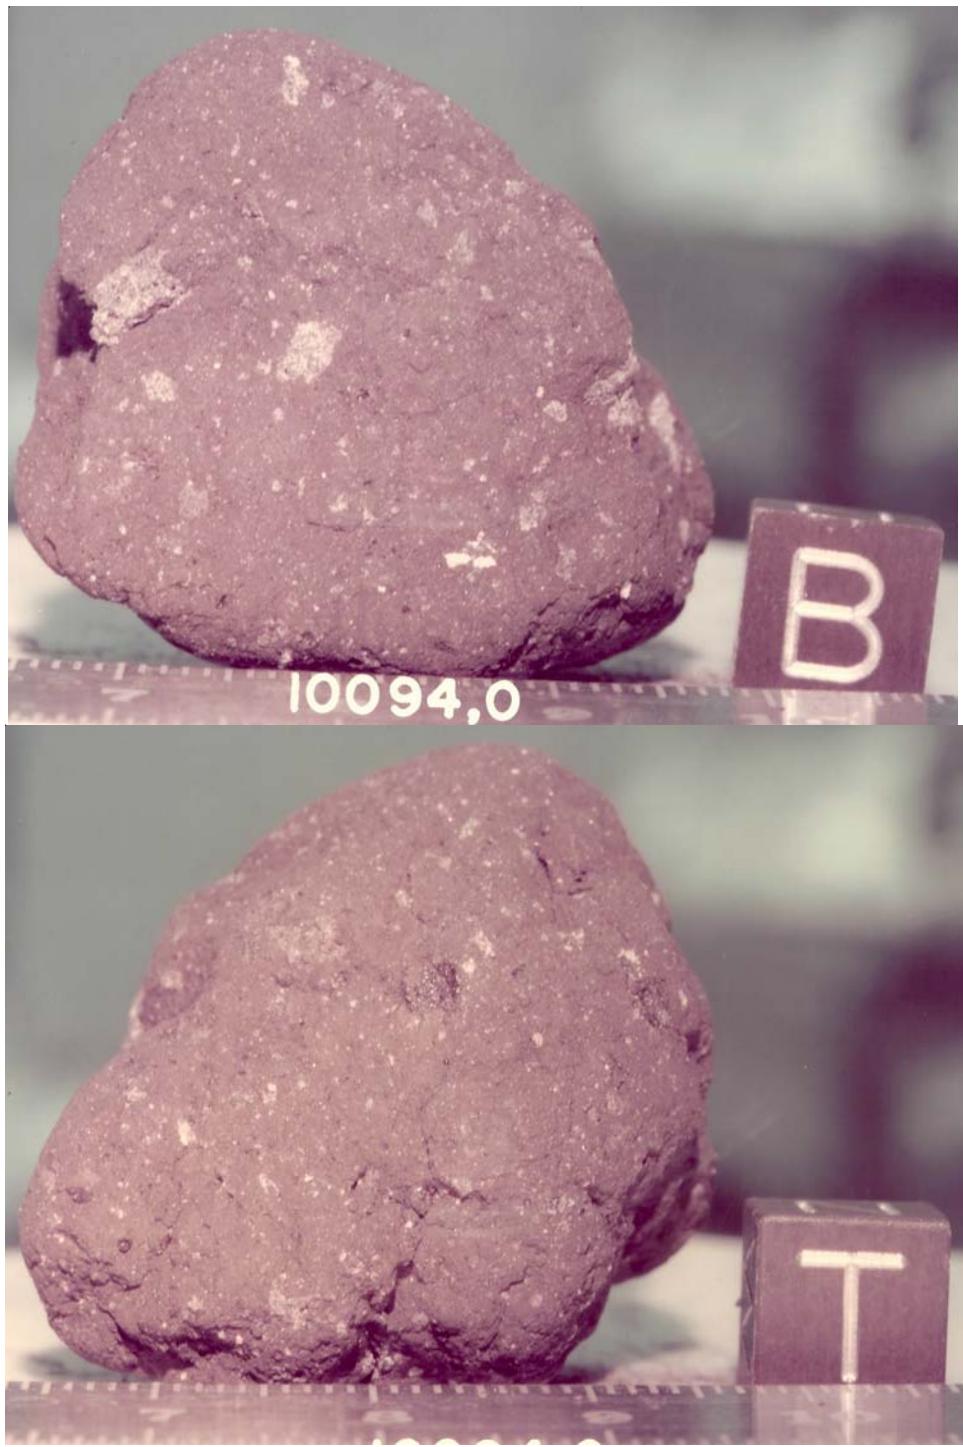

Figure 2: Two more photos of 10094. Cube is 1 cm. S76-26001 and 2.

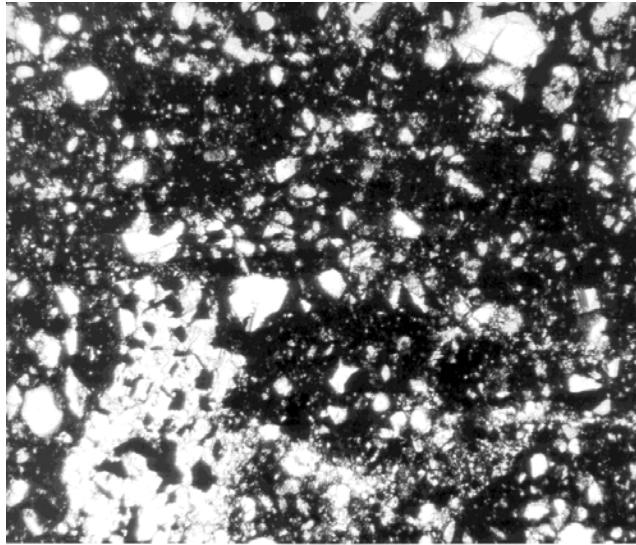

Figure 3: Photomicrograph of thin section 10094, showing dark matrix including mineral and basalt clasts. NASA S76-28122. Scale 2.5 mm.

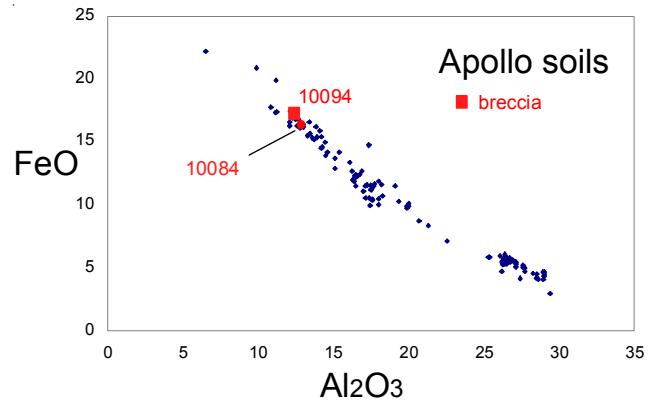

Figure 4: Composition of 10094 compared with Apollo soils.

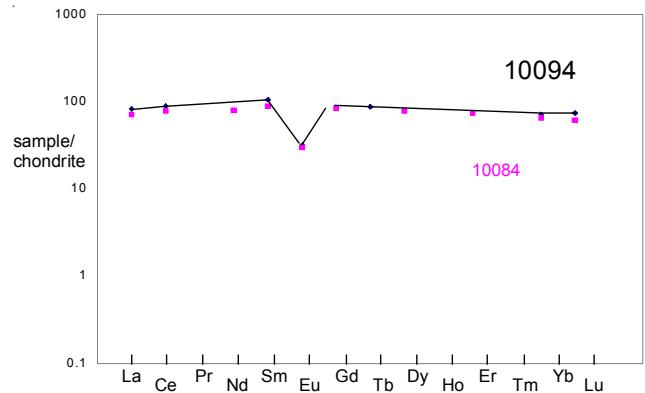

Figure 5: Normalized rare earth element diagram for breccia 10094 compared with soil 10084 (data from Wiesmann et al. 1975).
